Preparing Teachers to Teach Modern Mathematics Curriculum: The Role of Mathematics Teacher Educators in Teaching and Learning About Data

Hollylynn S. Lee
Judith Jacobs Lecture, AMTE 2026

I am honored and humbled to be here

**Thank you to my
advisor, Joe Garofalo**

For introducing me to the AMTE
community

About Me

- I went to 8 different schools in 4 different cities and 2 states
- I am a Wife, Mother, Daughter, Sister, Niece, Cousin, Aunt, Great Aunt, & Friend
- Former middle and high school math teacher
- Wife of a mathematician (Todd), mother to Delta, 20 and Jonah, 17
- Since 2000, faculty in STEM Education with ties with Statistics
- Visiting Professor at Baylor University in 2023
- Serve on National Academies' Mathematical Sciences Education Board.

All grants from 2004-current discussed in this presentation were funded by the National Science Foundation, Institute of Educational Sciences, William and Flora Hewlett Foundation, or RTI International to NC State University.

The findings and opinions expressed are those of the presenter and not the funding agencies.

Thank You for Contributing to the Survey!

The Movement

Oregon has been leading the way!

- Introduced a K-12 strand on data reasoning
- Created a 2+1 model for math pathways in high school
- Finalized 2021, first implemented 2023-24

Oregon Data Reasoning Strand K-12

FIRST GRADE

1.DR.A.1 Generate questions to investigate situations within the classroom. Collect or consider data that can naturally answer questions by representing data visually.

1.DR.B.2 Analyze data sets with up to three categories by representing data visually, such as with graphs and charts, and interpret information presented to answer investigative questions.

HIGH SCHOOL

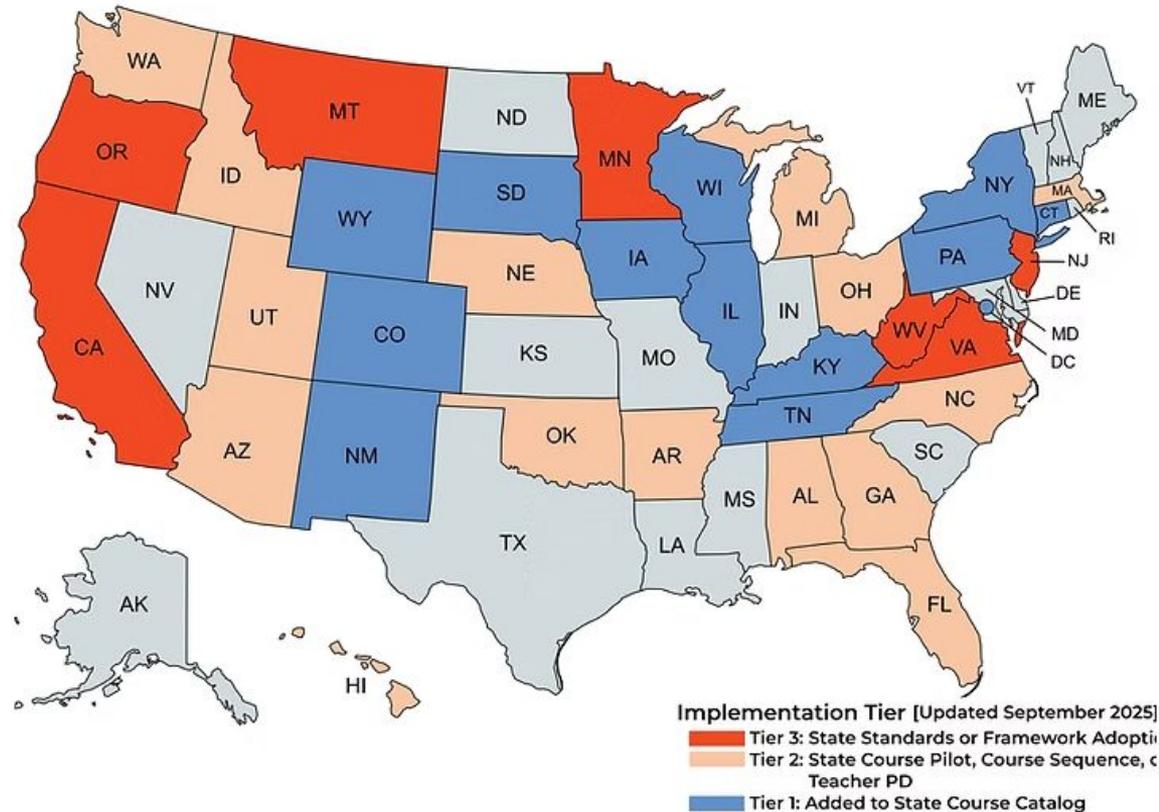

HS.DR.D.12 Articulate what it means for an outcome or an estimate of a population characteristic to be plausible or not plausible compared to chance variation.

HS.DR.D.13 Use multivariate thinking to articulate how variables impact one another, and measure the strength of association using correlation coefficients for regression curves.

Have You Heard of

Data science is spreading across the country...

State-wide data science education implementation (September 2025)

Teaching Data Science in High Schools

Position statement --March 2024

Data science is a rigorous, engaging, and practical field of study and can be a significant part of a high school student's mathematical experience.

Knowledge of data science is important, and a data science course should be accepted as a high school mathematics course that can be used for credit towards graduation...

All students should have the opportunity to take four years of high school mathematics, and data science content should be available to all students in order to complete their high school mathematics graduation requirement.

Data Science in K-12 Education

Data Science in K-12 Education -- April 2024

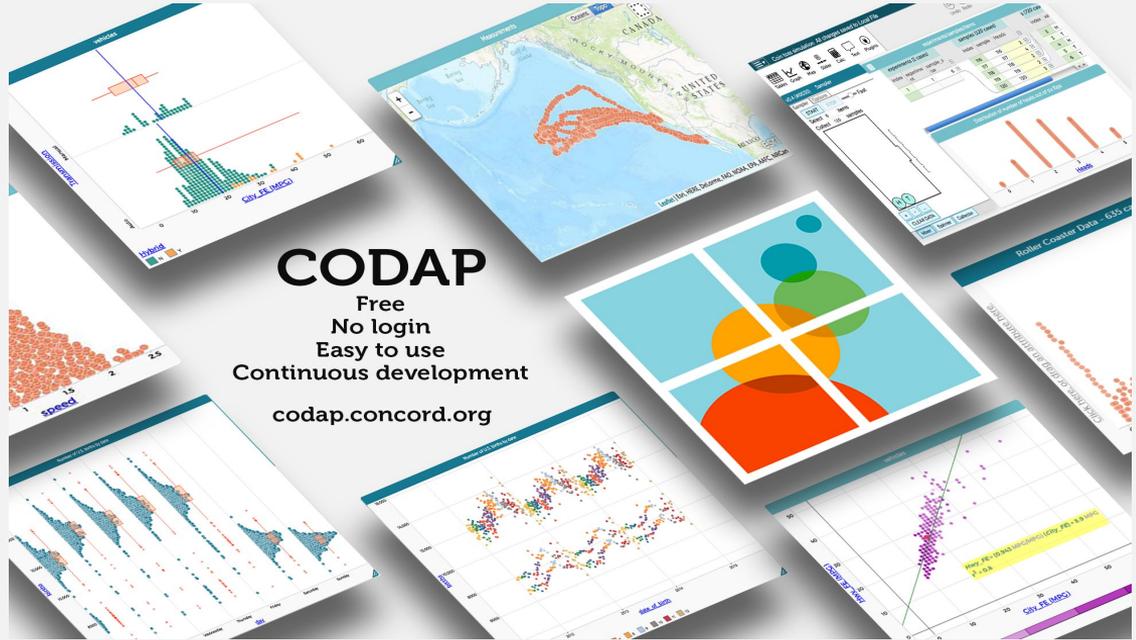

Data science bridges disciplines and thus should be introduced and taught across the curriculum in K-12 schools to help develop informed users of data....

All subjects in school should recognize the contribution of data to their discipline and take curricular approaches that integrate data with disciplinary lessons where appropriate.

Examining Students' Practices in Algebra and Function

These materials connect with the Teaching Algebra materials to support teachers' development of pedagogical skills related to professional noticing of student thinking and engaging in productive discussions in technology-mediated learning environments. Teachers engage in tasks and analyze videos of students' work.

Teaching Statistics Investigations

This set of materials includes four chapters that prepare teachers to use large multivariate data and a new free online tool, CODAP, to engage in similar investigations as in Chapters 1-4 of the Teaching Data Analysis and Probability materials.

New Teaching Geometry

Coming Soon.....

Voices from the Field

A collection of video clips representing how real teachers use technology in their mathematics classrooms. Some clips illustrate how teachers and students use technology in lessons. Other clips show teachers and experts discussing issues related to their planning and implementation of technology.

Teaching Algebra

The Teaching Algebra materials consist of 7 chapters that provide strategies for teaching algebra with dynamic technology explorations of important topics such as variables, equality, rate of change, and functions.

Teaching Data Analysis and Probability

This set of materials includes 6 chapters that utilize tools such as TinkerPlots, Fathom, Excel, and graphing calculators to engage teachers in statistics investigations using multivariate data. Topics include learning to teach distributions, variability, bivariate relationships, probability, and simulations.

Teaching Geometry

The 7 chapters in the Teaching Geometry materials engage teachers with how dynamic approaches to geometry can change students' understanding of concepts such as polygon properties, transformations, similarity, and symmetry.

Forging Connections Between Geometry and Functions

A collection of materials on an *external site* that were developed through a PTMT-related project. Activities use web-based Sketchpad activities to develop deeper understandings of functions through a geometric approach.

- E6: Data Visualizations for Use in Classrooms ~30 Minutes ✓

Extended Resources

Optional resources to support your learning.

- Classroom Ready: Discourse Prompts: Making Sense of Data Visualizations ~10 Minutes ○

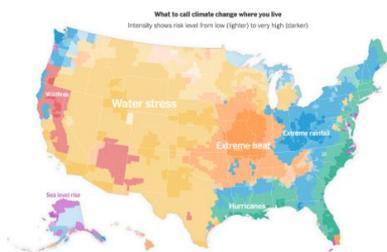

ESSENTIAL 2

Importance of Discourse about Data Visualizations

~20 Minutes

Data visualizations offer "an alternative venue for teaching core statistical topics and an opportunity to emphasize statistical thinking over calculations." (Nolan & Perrett, 2016, p. 268)

Visualizations are increasingly used in popular news and media outlets to communicate information to various audiences and provide visuals to support claims or arguments with data. While simple bar graphs, histograms, pie graphs, scatterplots and line graphs (trend lines or time series graphs) were once the standard displays used in media, today's advanced technological capabilities have led to many new ways to visualize data. Such visualizations often use color, shape, size, and geographic or spatial location to represent aspects of data or statistical measures such as an average, proportion, or ranking. For example, the visualization on this map uses different colors for each county boundary in the U.S. to represent the highest ranked climate threat (e.g., yellow is used for water stress, purple represents sea level rise) with darker shades indicating a higher threat. (Map visualization used with permission from [New York Times "What's Going on in this Graph: Climate Threats"](#)). On the NYT's webpage, a user can interact with this visualization to investigate the climate risk rankings by hovering over a county on the map.

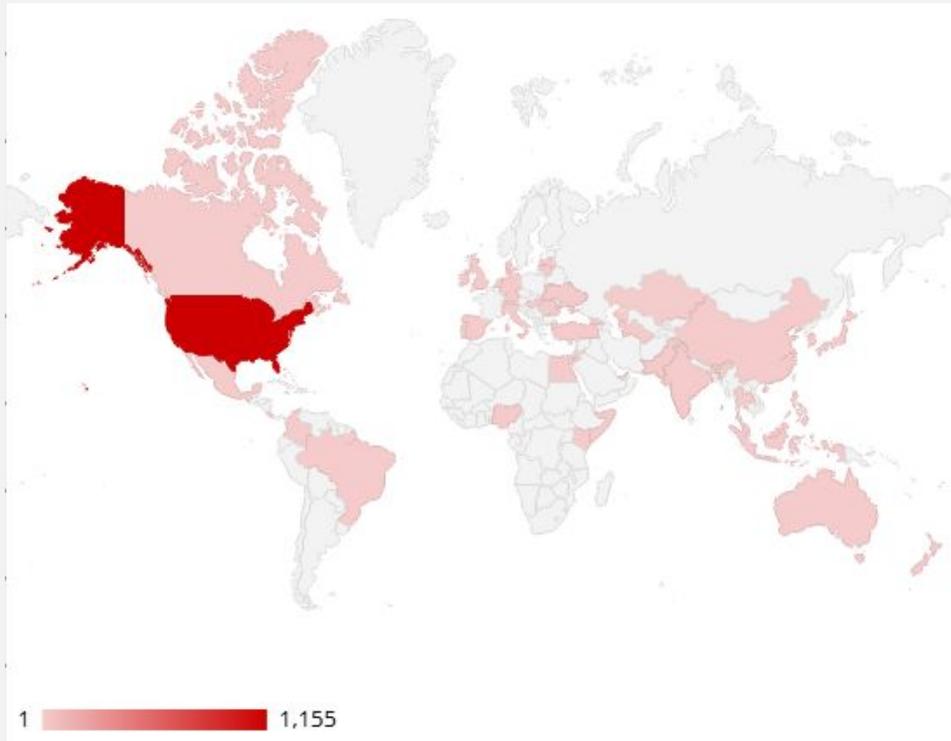

Other examples of interactive components in a data visualization include adding motion to illustrate changes of

Data Investigation Process

Holistic, Dynamic and Nonlinear

Key Considerations & Dispositions

Make sense of data with respect to context	Take advantage of technology	Attend to variability & uncertainty	Seek expertise & information	Communicate & collaborate	Be curious creative, & intuitive	Persist & be resilient	Consider ethical issues & biases	Be a skeptic
--	------------------------------	-------------------------------------	------------------------------	---------------------------	----------------------------------	------------------------	----------------------------------	--------------

Lee et al., 2022
SERJ

**How Can We Help
The Next
Generation
Experience
Modern Math and
See the World
Through Data?**

**How have we engaged in our state towards
a more modern curriculum?**

EVERYONE Needs to Make Sense of Data to Inform Decisions

“By asking questions such as, “**Who produced this research? How were the data collected and analyzed? How do the context and conditions under which the data were collected shape the findings?**” and “**What perspectives or interests might influence the conclusions?**” mathematics leaders can make better-informed decisions and, as a result, better support the teaching and learning of mathematics in their own context. “

(p. 9, NCSM, 2025 Position Statement “Strengthening Research-informed Decision Making for Mathematics Education”)

Mathematics Teacher Educators make a difference every day in the lived mathematical experiences of teachers and students.

Together we can grow a new generation that uses the mathematical sciences to solve tomorrow's problems, understand the impact of data and statistics to inform decisions and understand our world in ways that can lead to better neighbors.

Bonus Advice

- Great research does not have to be funded
- Impact and dissemination is NOT just publishing
- About 1/3 of your papers will never be finished and published
- Be nice. Others will want to play with you
- Take time to play
- Family first
